

Exercise 1: Student Attendance & Eligibility System

```
namespace ConsoleLearning
{
    internal class Demo1
    {
        static void Main(string[] args)
        {
            Console.Write("Enter total days: ");
            int totalDays = int.Parse(Console.ReadLine());
            int presentDays = 0;
            for (int i = 1; i <= totalDays; i++)
            {
                Console.Write("Enter attendance for day " + i + " (1=Present, 0=Absent): ");
                presentDays += int.Parse(Console.ReadLine());
            }
            double percentage = (double)presentDays / totalDays * 100;
            Console.WriteLine("Actual Percentage : " + percentage);
            Console.WriteLine("Rounded Percentage : " + (int)Math.Round(percentage));
            Console.WriteLine("Truncated Percent : " + (int)percentage);
        }
    }
}
```

Exercise 2: Online Examination Result Processing

```
namespace ConsoleLearning
{
    internal class Exercise
    {
        static void Main(string[] args)
        {
```

```

    Console.Write("Enter marks 1: ");
    int m1 = int.Parse(Console.ReadLine());
    Console.Write("Enter marks 2: ");
    int m2 = int.Parse(Console.ReadLine());
    Console.Write("Enter marks 3: ");
    int m3 = int.Parse(Console.ReadLine());
    double average = (m1 + m2 + m3) / 3.0;
    Console.WriteLine("Average Marks: " + average);
    Console.WriteLine("Scholarship Score: " + (int)Math.Round(average));
}
}
}

```

Exercise 3: Library Fine Calculation System

```

namespace ConsoleLearning
{
    internal class Exercise
    {
        static void Main(string[] args)
        {
            Console.Write("Enter fine per day: ");
            decimal finePerDay = decimal.Parse(Console.ReadLine());
            Console.Write("Enter days late: ");
            int daysLate = int.Parse(Console.ReadLine());
            decimal totalFine = finePerDay * daysLate;
            double loggedFine = (double)totalFine;
            Console.WriteLine("Total Fine (Decimal): " + totalFine);
            Console.WriteLine("Logged Fine (Double): " + loggedFine);
        }
    }
}

```

```
}
```

Exercise 4: Banking Interest Calculation Module

```
namespace ConsoleLearning
```

```
{
```

```
    internal class Exercise
```

```
    {
```

```
        static void Main(string[] args)
```

```
        {
```

```
            Console.Write("Enter account balance: ");
```

```
            decimal balance = decimal.Parse(Console.ReadLine());
```

```
            Console.Write("Enter interest rate: ");
```

```
            float rate = float.Parse(Console.ReadLine());
```

```
            decimal interest = balance * (decimal)rate / 100;
```

```
            balance += interest;
```

```
            Console.WriteLine("Updated Balance: " + balance);
```

```
        }
```

```
    }
```

```
}
```

Exercise 5: E-Commerce Order Pricing Engine

```
namespace ConsoleLearning
```

```
{
```

```
    internal class Exercise
```

```
    {
```

```
        static void Main(string[] args)
```

```
        {
```

```
            Console.Write("Enter cart total: ");
```

```
            double cartTotal = double.Parse(Console.ReadLine());
```

```
            Console.Write("Enter tax rate (e.g. 0.18): ");
```

```

        decimal taxRate = decimal.Parse(Console.ReadLine());
        decimal total = (decimal)cartTotal;
        decimal tax = total * taxRate;
        Console.WriteLine("Final Amount: " + (total + tax));
    }
}
}

```

Exercise 6: Weather Monitoring & Reporting

```

namespace ConsoleLearning
{
    internal class Exercise
    {
        static void Main(string[] args)
        {
            Console.Write("Enter temperature 1: ");
            short t1 = short.Parse(Console.ReadLine());
            Console.Write("Enter temperature 2: ");
            short t2 = short.Parse(Console.ReadLine());
            Console.Write("Enter temperature 3: ");
            short t3 = short.Parse(Console.ReadLine());
            double avgTemp = (t1 + t2 + t3) / 3.0 / 10;
            Console.WriteLine("Average Temperature: " + avgTemp);
            Console.WriteLine("Displayed Temp: " + (int)Math.Round(avgTemp));
        }
    }
}

```

Exercise 7: University Grading Engine

```

namespace ConsoleLearning

```

```

{
    internal class Exercise
    {
        static void Main(string[] args)
        {
            Console.Write("Enter final score: ");
            double score = double.Parse(Console.ReadLine());
            byte grade;
            if (score >= 90)
                grade = 10;
            else if (score >= 80)
                grade = 9;
            else if (score >= 70)
                grade = 8;
            else
                grade = 7;
            Console.WriteLine("Grade: " + grade);
        }
    }
}

```

Exercise 8: Mobile Data Usage Tracker

```

namespace ConsoleLearning
{
    internal class Exercise
    {
        static void Main(string[] args)
        {
            Console.Write("Enter data used (bytes): ");
            long bytesUsed = long.Parse(Console.ReadLine());

```

```

        double gb = bytesUsed / (1024.0 * 1024 * 1024);
        Console.WriteLine("Data Used (GB): " + gb);
        Console.WriteLine("Rounded GB: " + (int)Math.Round(gb));
    }
}
}

```

Exercise 9: Warehouse Inventory Capacity Control

```

namespace ConsoleLearning
{
    internal class Exercise
    {
        static void Main(string[] args)
        {
            Console.Write("Enter current stock: ");
            int stock = int.Parse(Console.ReadLine());
            Console.Write("Enter max capacity: ");
            ushort capacity = ushort.Parse(Console.ReadLine());
            if (stock <= capacity)
            {
                Console.WriteLine("Stock is within capacity");
            }
            else
            {
                Console.WriteLine("Stock exceeds capacity");
            }
        }
    }
}

```

Exercise 10: Payroll Salary Computation

```

namespace ConsoleLearning
{
    internal class Exercise

```

```
{  
    static void Main(string[] args)  
    {  
        Console.Write("Enter basic salary: ");  
        int basic = int.Parse(Console.ReadLine());  
        Console.Write("Enter allowance: ");  
        double allowance = double.Parse(Console.ReadLine());  
        Console.Write("Enter deduction: ");  
        double deduction = double.Parse(Console.ReadLine());  
        decimal netSalary =  
            basic +  
            (decimal)allowance -  
            (decimal)deduction;  
        Console.WriteLine("Net Salary: " + netSalary);  
    }  
}
```
